

Did you know your plant room could be subject to chlorine gas, a potentially fatal and extremely harmful gas? Are you and your staff protected from a chlorine gas incident?

This is where the GMS plus gas detection system comes in.

This flexible multi-function device warns the operating personnel if a defined concentration of gas is reached in the air, alerting them to evacuate to safety.

The GMS plus is a flexible two channel measuring system designed for gas monitoring in up to two rooms. It can either use a single Chloratec sensor or a pair of Chloratec sensors to measure chlorine gas. The gas concentrations are displayed on the display panel. The peak and average values over the past 8 hours can also be displayed. The desired alarm levels can be set using the menu via a control pad. Two values per channel can be specified. An alarm contact is activated for each limit value and the system will also set off an audible and a visual alarm.

Sterling Hydrotech Ltd, can supply, deliver, install and commission a GMS plus unit for you.
